

Oleksandr Boiko

Full-Stack Developer — Next.js / React / TypeScript · Web Performance · AI Prototype → Production

Kyiv, Ukraine · UTC+2/+3 · Open to remote

boikoale97@gmail.com · [LinkedIn](#) · [GitHub](#)

Summary

Full-stack developer working in Next.js, React, and TypeScript. I'm at my best in two situations: when a web app needs to get faster, and when a prototype — often AI-generated — needs to become a real product. Tools like v0 and Lovable get a product to ~70%; I ship the last 30% — a real backend instead of mocks, performance, SEO, and code a team can maintain. I treat every task as a business problem first: before writing code I ask what the change should move — conversion, load time, or manual work.

Skills

- **Frontend:** React, Next.js (App Router, Server Components), TypeScript, Tailwind CSS, shadcn/ui, MaterialUI, Figma, TanstackQuery, Jotai, Zustand
- **Performance:** Core Web Vitals (LCP / INP / CLS), bundle size, code splitting, rendering strategy, image & font optimization
- **Backend:** Node.js, NestJS, PostgreSQL (Prisma), Redis, REST
- **Infra / tooling:** Docker, CI/CD, Vercel, Sentry
- **AI-assisted workflow:** taking v0 / Lovable / Bolt output to production; AI tooling in daily workflow

- *Also worked with:* Groovy, Camunda, Jenkins, MongoDB, MySQL, Angular, Firebase, GraphQL, Swagger, Liquibase, Gerrit

Experience

Full-Stack Developer — Self-employed

Mar 2025 — Present · Remote · SaaS product for the tattoo industry

- Building Quarry.ink solo, from architecture to production — a SaaS for tattoo studios and artists: booking, portfolios, events, CRM, and an ads manager.
- Designed the full stack: Next.js (App Router) frontend, NestJS + PostgreSQL (Prisma) backend, CI/CD to Vercel and Railway.
- Built the booking flow end-to-end — Stripe payments with idempotent webhooks, so retries never double-charge.
- Implemented custom authentication with role-based access for artists.

Full-Stack Developer — RealTalk

Sep 2024 — Mar 2025 · Kyiv · govtech platform for data digitization

- Built a public portal for digitizing data from state-owned enterprises: PostgreSQL, Camunda BPM, Form.io, JavaScript, Groovy.
- Designed and implemented complex Camunda BPMN workflows, ensuring accurate execution of business logic.
- Implemented complex multi-step submission forms on Form.io, with validation and error handling.
- Architected and optimized database schemas; authored SQL queries and views for efficient data retrieval.
- Developed and documented RESTful APIs with Swagger; integrated services with the frontend and third-party systems.
- Automated database migrations with Liquibase and maintained Jenkins-based CI/CD pipelines, reducing deployment time and

- manual steps; enforced code quality through Gerrit code reviews.
- Gathered and clarified complex requirements directly from government stakeholders in workshops and design reviews.
- Built reusable UI components for internal admin portals to streamline data entry and monitoring.

Frontend Developer — Cigarlands

Mar 2023 — Sep 2024 · Kyiv · cigar auction startup

- Helped launch the startup and build its MVP; assisted in selecting the tech stack: Next.js, React, TypeScript, Tailwind CSS.
- Built the frontend of a real-time auction: bidding UI with live price updates over WebSockets, lot pages, checkout.
- Handled reconnects and race conditions in live bidding.
- Shipped core features on Next.js (SSR/SSG): authentication, filtering, dynamic routing.
- Optimized performance — lazy loading, critical CSS, fewer network requests via streamlined REST/GraphQL calls — improving key page load times.
- Built responsive layouts from Figma mockups and a library of reusable UI components.
- Introduced ESLint and Prettier guidelines, ran team code reviews, and documented architecture in Confluence.
